

Additional documentation for “Exotic ribbon disks and symplectic surfaces”

KYLE HAYDEN

This is a guide to the computer-assisted proofs in [4]. All files referenced below are located on the site [3]. The calculations described rely on the software SnapPy [1] and the knot Floer homology calculator [5]. The SnapPy calculations can be verified by running SnapPy inside Sage [6]; see the official SnapPy documentation regarding verified computations.

Notation. For a link \mathcal{L} with ordered components L_1, \dots, L_n and a choice of Dehn filling slopes $r_1, \dots, r_n \in \mathbb{Q} \cup \infty$, let $\mathcal{L}(r_1, \dots, r_n)$ denote the 3-manifold obtained by Dehn filling $S^3 \setminus \mathcal{L}$ along the component L_i with slope r_i . If L_i is not filled, we write $r_i = *$.

A. Proof of Theorem 1.2

SnapPy

We follow the notation from [4] wherever possible. The first claim to verify is that $S^3 \setminus K$ admits a hyperbolic structure with trivial isometry group for $m = 0$ and $m \ll 0$, where K is the knot in ∂B^4 corresponding to the dashed curve in Figure 1(a) below. In Figure 1(b), we have recast K using another surgery description of S^3 . To describe this precisely, let \mathcal{L} denote the link with (ordered) components A , B , γ , and κ depicted in Figure 1(b). Then $S^3 \setminus K$ is diffeomorphic to $\mathcal{L}(0, 0, -1/m, *)$, i.e. the 3-manifold obtained from Dehn filling $S^3 \setminus \mathcal{L}$ along the link components A , B , and γ with framings zero, zero, and $-1/m$, respectively.

Figure 1

We claim that $\mathcal{L}(0, 0, *, *)$ admits a hyperbolic structure with trivial isometry group. The diagram for \mathcal{L} is saved as the SnapPy projection file `L2.lnk`. Using SnapPy's link editor, we extracted a Dowker-Thistlethwaite code for this link:

$$\text{DT: } [(6,8),(14,22,16,28,18,24,26,-30),(4,2,10),(12,-20)] = [\kappa, A, B, \gamma].$$

To verify that $\mathcal{L}(0, 0, *, *)$ admits a hyperbolic structure with trivial isometry group using SnapPy, we ran the commands in the file `L2-input.py`. (These commands may be entered manually or by opening the file `L2-input.py` in SnapPy.) The activity log is reproduced below; see the file `L2-output.py` for a copy saved by SnapPy.

```
In: L=Manifold('DT: [(6,8),(14,22,16,28,18,24,26,-30),(4,2,10),(12,-20)]')
In: L.dehn_fill((0,1),1)
In: L.solution_type()
Out: 'all tetrahedra positively oriented'
In: L.dehn_fill((0,1),2)
In: Y=L.filled_triangulation()
In: Y.solution_type()
Out: 'all tetrahedra positively oriented' (A1)
In: Y.symmetry_group()
Out: 0 (A2)
In: L.dehn_fill((1,0),3)
In: Y0=L.filled_triangulation()
In: Y0.solution_type()
Out: 'all tetrahedra positively oriented' (A3)
In: Y0.symmetry_group()
Out: 0 (A4)
```

In the log above, Y corresponds to $\mathcal{L}(0, 0, *, *)$, and lines A1 and A2 imply that $\mathcal{L}(0, 0, *, *)$ admits a hyperbolic structure with trivial isometry group. By [2, Lemma 2.2], the same is true of $\mathcal{L}(0, 0, -1/m, *)$ for $|m| \gg 0$, including $m \ll 0$, as claimed.

Similarly, $Y0$ corresponds to $\mathcal{L}(0, 0, \infty, *)$, which admits a hyperbolic structure with trivial isometry group by lines A3 and A4. The slope ∞ corresponds to $-1/m$ for $m = 0$. This implies that $S^3 \setminus K$ admits a hyperbolic structure with trivial isometry group for $m = 0$, as claimed.

HFk Calculator

The next claim to verify is that the knot L_0 shown in [4, Figure 4(f)] has $\tau(L_0) = 2$. A diagram of L_0 is saved as the SnapPy projection file `L0knot.lnk`. From these diagrams, we used SnapPy's link editor to extract Planar Diagram codes for L_0 . This PD code is saved as `L0knot.txt`, formatted for use with [5]. We then used this file to complete the desired calculation, following the documentation for [5]; the resulting activity log is copied into the summary file `L0knot-summary.txt`. In particular, the output tells us $\tau(L_0) = 2$.

B. Proof of Theorem 1.1

As above, we follow the notation in [4]. The claim to verify is that $S^3 \setminus (K_0 \cup \gamma)$ admits a hyperbolic structure with trivial isometry group for $m = 0$ and $m \ll 0$. The diagram for the link $K_0 \cup \gamma$ is saved as the SnapPy projection file `L1.lnk`. Using SnapPy’s link editor, we extracted a Dowker-Thistlethwaite code for this link:

$$\begin{aligned} \text{DT: } & [(-88, -34, -78, -42, 66, -24, -76, 4, 92, -30, 54, -70, 38, \\ & -8, 80, -90, 46, -14, -58, -68, 26, -56, -16, 94, 62, -72, \\ & -82, -28, 6, 12, -86, 52, 22, -40, 10, 84, -50, -60, 36, 44, \\ & -20, -64, 74), (-2, 48, 18, -32)] \\ & = [K_0, \gamma] \end{aligned}$$

To verify that $S^3 \setminus (K_0 \cup \gamma)$ admits a hyperbolic structure with trivial isometry group using SnapPy, we ran the commands in the file `L1-input.py`. (These commands may be entered manually or by opening the file `L1-input.py` in SnapPy.) The activity log is reproduced below; see the file `L1-output.py` for a copy saved by SnapPy.

```
In: L=Manifold('DT:[(-88,-34,-78,-42,66,-24,-76,4,92,-30,54,-70,38,-8,80,
-90,46,-14,-58,-68,26,-56,-16,94,62,-72,-82,-28,6,12,-86,52,22,-40,10,84,
-50,-60,36,44,-20,-64,74),(-2,48,18,-32)]')
In: L.solution_type()
Out: 'all tetrahedra positively oriented'
In: L.symmetry_group()
Out: 0
```

C. Proof of Theorem 1.1

We continue to follow the notation in [4]. The claim to verify is that $S^3_{-2}(L_m)$ admits a hyperbolic structure with trivial isometry group for $m \ll 0$, where L_m is the Legendrian link shown in Figure 2(a) below (and [4, Figure 16(a)]). Letting $\mathcal{L} = L_0 \cup \gamma$ be the link shown in Figure 2(b), we have

$$S^3_{-2}(L) = S^3_{-2,-1/m}(L_0 \cup \gamma) = \mathcal{L}(-2, -1/m).$$

We claim that $\mathcal{L}(-2, *)$ admits a hyperbolic structure with trivial isometry group. The diagram for the link $\mathcal{L} = L_0 \cup \gamma$ is saved as the SnapPy projection file `L3.lnk`. In our next calculation, we will be performing Dehn filling with nonzero slopes, so it is important that the link is entered into SnapPy with the correct chirality; that is, we must take care to work with \mathcal{L} and not its mirror. For this reason, we encode the diagram of \mathcal{L} using a

Figure 2

Planar Diagram code instead of a Dowker-Thistlethwaite code, extracted from `L3.lnk` using SnapPy's link editor:

```
PD: [(47, 39, 48, 38), (36, 50, 37, 49), (32, 44, 33, 43), (46, 30, 47, 29), (27, 49, 28, 48),
      (28, 37, 29, 38), (39, 26, 40, 27), (25, 40, 26, 41), (24, 36, 25, 35), (45, 18, 46, 19),
      (30, 18, 31, 17), (15, 42, 16, 43), (14, 34, 15, 33), (22, 13, 23, 14), (10, 23, 11, 24),
      (8, 42, 9, 41), (9, 34, 10, 35), (44, 6, 45, 5), (31, 6, 32, 7), (16, 8, 17, 7), (2, 22, 3, 21),
      (1, 13, 2, 12), (11, 1, 12, 50), (51, 20, 52, 21), (54, 4, 51, 3), (19, 52, 20, 53), (4, 54, 5, 53)]
```

When fed to SnapPy, this encodes \mathcal{L} as an (ordered) two-component link whose first component is L_0 and whose second component is γ . To verify that $\mathcal{L}(-2, *)$ admits a hyperbolic structure with trivial isometry group using SnapPy, we ran the commands in the file `L3-input.py`. (These commands may be entered manually or by opening the file `L3-input.py` in SnapPy.) The activity log is reproduced below; see the file `L3-output.py` for a copy saved by SnapPy.

```
In: TheLink=Link([[47,39,48,38],[36,50,37,49],[32,44,33,43],[46,30,47,29],
[27,49,28,48],[28,37,29,38],[39,26,40,27],[25,40,26,41],[24,36,25,35],
[45,18,46,19],[30,18,31,17],[15,42,16,43],[14,34,15,33],[22,13,23,14],
[10,23,11,24],[8,42,9,41],[9,34,10,35],[44,6,45,5],[31,6,32,7],
[16,8,17,7],[2,22,3,21],[1,13,2,12],[11,1,12,50],[51,20,52,21],
[54,4,51,3],[19,52,20,53],[4,54,5,53]])
In: L=TheLink.exterior()
In: L.dehn_fill((-2,1),0)
In: L.solution_type()
Out: 'all tetrahedra positively oriented'
In: L.symmetry_group()
Out: 0
```

This implies that $\mathcal{L}(-2, *)$ admits a hyperbolic structure with trivial isometry group. By [2,

Lemma 2.2], the same is true of $\mathcal{L}(-2, -1/m)$ for $|m| \gg 0$, including $m \ll 0$, as claimed.
